Analytical methods applied:

Pb - Atomic emission spectrometry with ICP, Atomic absorption spectrometry

Cd - Atomic emission spectrometry with ICP, Atomic absorption spectrometry

Ni - Atomic emission spectrometry with ICP, Atomic absorption spectrometry

As - Atomic emission spectrometry with ICP, Atomic absorption spectrometry

Bi - Atomic emission spectrometry with ICP, Atomic absorption spectrometry

Fe - Atomic emission spectrometry with ICP, Atomic absorption spectrometry

Zn - Atomic emission spectrometry with ICP, Atomic absorption spectrometry

Cu - Atomic emission spectrometry with ICP, Atomic absorption spectrometry titration

Sb - Atomic emission spectrometry with ICP, Atomic absorption spectrometry titration

The chemical analyses have been carried out in four laboratories including laboratory of the Institute of Non-Ferrous Metals using different methods. Bearing alloy CRMs were made by melting of all components in the core less induction furnace and by casting into special cast iron moulds.

Homogeneity investigations were made taking account 30 % of the material produced. Investigations were carried out using atomic emission spectrometry method with low voltage spark.

Homogeneity was estimated statistically with application of the test F.

The set consists of 5 CRMs is in form of discs 40 mm in diameter and 20 mm in height.
