Analytical methods applied:

- Ni - ICP AES, AAS directly, weight method, titration*
- Pb - ICP AES, AAS directly*
- Fe - ICP AES, AAS directly*
- Mn - ICP AES, AAS directly*
- Sn - ICP AES, AAS directly and after coprecipitation on Fe (OH)₃*
- Al - ICP AES, AAS directly and after coprecipitation on Fe (OH)₃*
- As - ICP AES, AAS directly and after coprecipitation on Fe (OH)₃*
- Cd - ICP AES, AAS directly*
- Sb - ICP AES, AAS directly and after coprecipitation on Fe (OH)₃*
- Bi - ICP AES, AAS directly and after coprecipitation on Fe (OH)₃*
- P - ICP AES*
- Si - AAS directly, weight method*
- Cu - electrolysis, titration*

The chemical analysis have been carried out in three specialistic industrial laboratories from Poland and in the laboratory of the Institute of Non-Ferrous Metals. Melts have been performed using induction furnace. Nickel-brass CRMs are

in form of discs 40 mm in diameter and 30 mm height. Homogeneity investigations were made taking into account over 30 % of the material produced. Investigations were carried out using atomic emission spectrometry method with low voltage spark.

Homogeneity was estimated statistically with application of the test F.
Application of CRMs - Atomic emission spectrometry

- X-Ray spectrometry

CRMs are stable in time.
